

Custom Design velocity stack

DICKS Cool Unit is the name given to the new velocity stack created by Kirk Taylor at Custom Design Studio.

Machined from aircraft grade aluminum, it bolts directly to Mikuni carbs, and adaptors are being prepared for CV and S&S carburetors as well as H-D EFI units up to 2007. Finished in raw aluminum with a black anodized base, the stacks have already been featured on several of the company's custom builds including the bike Blood on Blood.
